

Equilíbrio Químico – Kc e Kp

Equilíbrio Químico *Rendimento da Reação*

Ocorre quando, em uma reação reversível, a velocidade da reação direta torna-se igual à da inversa.

Observações

- 1- O equilíbrio é dinâmico.
- 2- No equilíbrio a concentração de reagentes e produtos fica constante.
- 3- Ocorre em sistema fechado.

Entendendo

$$V_d = K_d \cdot [A] [B]$$

$$V_i = K_i \cdot [C] [D]$$

Constante de Equilíbrio

K_c

$$V_d = k \cdot [A][B]$$

$$V_i = k \cdot [C][D]$$

$$\text{NO equil.} = V_d = V_i$$

$$k_d \cdot [A][B] = k_i \cdot [C][D]$$

$$\frac{k_d}{k_i} = \frac{[C][D]}{[A][B]}$$

$$K_c = \frac{[\text{Prod}]}{[\text{reagentes}]}$$

$\rightarrow \uparrow K_c$
 $\uparrow \text{Prod}$
 $\uparrow \text{rendi.}$

Quem não entra no cálculo de K_c ?

Sólido e solvente de reação
(água)

Aq = água solvente
NÃO entra

Exemplos

Constante de Equilíbrio

Kp

$$\begin{aligned} V_d &= K_d \cdot [a]^a \\ V_d &= K_d \cdot P_a^2 \end{aligned} \left\{ \begin{array}{l} \text{Pressão e velocidade} \\ \text{são proporcionais} \end{array} \right.$$

Lembrando a pressão parcial

$$P_T = P_A + P_B$$

$$P_a \cdot V = N_a \cdot R \cdot T$$

$$P_a = \left(\frac{N_a}{V} \right) \cdot R \cdot T$$

$$P_x = [X] \cdot R \cdot T$$

Relação entre Kp e Kc

$$K_p = \frac{P_b^b}{P_a^a}$$

$$K_p = \frac{([B] \cdot R \cdot T)^b}{([A] \cdot R \cdot T)^a} = K_c \cdot (RT)^{b-a}$$

3

$$K_p = K_c (RT)^{\Delta n}$$

Exemplos importantes

$$K_p = K_c (RT)^{\Delta n}$$
$$K_p = K_c (RT)^{2-4}$$
$$K_p = K_c (RT)^{-2} //$$

$$K_p = K_c (RT)^{\Delta n}$$
$$K_p = K_c (RT)^{-1} //$$

$$K_p = K_c \cdot (RT)^{\Delta n}$$
$$K_p = K_c \cdot (RT)^0$$
$$K_p = K_c //$$

Anotações:
